### Summary of Sample Appearance and Analytical Laboratory Procedures

#### Sample Details

A crude oil sample from [Cairn India Limited](#) was received in our Labuan laboratory on [29<sup>th</sup>-Dec-16](#) for Full Blown Crude Assay. The detailed description of sample received is listed below.

Crude Name : **Ravva Oil**

Sampling Date : -

Sampling Time : **NA**

Sampled by : **NA**

#### Summary Of Sample Appearance

We found the sample is solid at ambient temperature (25°C). The sample present 2 liter of free water content and 12% by volume of emulsion. The emulsion, then has gone for a centrifuge process to ensure to get the dry oil as much as possible before conducting the Distillation by ASTM D2892.

A series of analyses was performed on the above sample to fulfill the analytical matrix indicated in Appendix 1. A brief description of the testing methods used are indicated below.

#### True Boiling Point Distillation (ASTM D2892)

This test provides a means to quantify the yields of fractions from various boiling ranges and is primarily used to quantify the commercial value of petroleum crudes. This method involves the distillation of petroleum crudes or like materials to end point of 400°C AET (Atmospheric Equivalent Temperature) using a fractionating column with efficiency of 14 through 18 theoretical plates. A reflux ratio of 5:1 is used throughout this process.

Fractions at cut points are recovered – typically this is requested by the client. Mass and density of each fraction are then measured. Distillation yields in mass % and volume % are calculated and are then illustrated in tabular and chart form. In cases where the end point of the distillation exceeds 400°C AET, this test is continued using the Potstill Distillation technique.

#### Potstill Distillation (ASTM D5236)

This test provides an estimate of yields on heavy hydrocarbon mixtures up to an end point of 565°C AET. This method utilizes total takeoff conditions and is used in conjunction with TBP Distillation (ASTM D2892) to generate a distillation curve beyond 400°C AET.

Fractions at client desired cut points are collected and mass and density for each fraction measured. Distillation yields in mass % and volume % are calculated and illustrated in tabular and chart form. The fractions collected by both these distillation techniques are used to perform various quantitative analyses to verify the quality of whole crude oil.

#### Extended Compositional Analysis of Liquid Hydrocarbons

This method covers the quantitative determination of petroleum crudes through C36 plus. This technique utilizes a gas chromatograph equipped with a temperature programmed on-column injector, a temperature programmed column oven, a wide bore column, an auto-sampler capable of injecting identical volumes and a flame ionization detector (FID). The analytical process involves the calculation of concentrations of individual hydrocarbons by means of comparing peak areas of a fully eluting external standard with sample crude oil.

#### Simulated Distillation (ASTM D7169)

This test involves the determination of boiling point distribution through 720°C of petroleum crudes by high temperature gas chromatography ( HTGC ). The end point of 720°C corresponds to nC100. This method utilizes a high temperature gas chromatograph equipped with on-column injector, a temperature programmed column oven, a short wide bore column capable of withstanding temperatures of 435°C, an auto-sampler capable of injecting identical volumes and a flame ionization detector (FID). The test process involves the use of an external reference standard oil to determine the boiling point distribution of petroleum crudes.

#### Fraction Analyses

Fractions collected during the distillation processes are then used for further analyses. A series of analyses as per the analytical test matrix depicted in Appendix 1 was performed. These tests were performed to industry recognized standards such as American Society for Testing and Materials (ASTM), Institute of Petroleum (IP) and Universal Oil Products (UOP). The test methods used to characterize the crude oil and fractions are listed in Appendix 2.

**Remarks :**

- 1) SG @60/60°F and the API is calculated using Table Measurement as mentioned in ASTM D1250.
- 2) ND : Not Detected
- 3) ## : Cannot perform the test due to the sample is solid at the test temperature.
- 4) Data for item number 5 is used Hydrometer technique and result for item number 6 is calculated using data from item number 5.

**Summary of test method ASTM D7112 using Porla Analyzer as below.**

Stability and compatibility parameters are determined by titration and optical detection of precipitate Asphaltenes. A stock Solution is prepared and three different mixtures of the sample oil plus Xylene are titrated with n-Heptane to cause precipitation of Asphaltenes. The titrated mixture is continuously circulated through an optical detector which detects precipitated Asphaltenes by back-scattering of visible light. The amount of Oil, Xylene and n-Heptane are used to calculate Stability parameters: Solvent Equivalent, P-value and FR5/1. If the density of a crude oil sample is known, then the compatibility parameters (SBN and IN) of the crude oil may also be calculated.

The principal of work for Porla Analyzer is based on titrating a mixture of oil and aromatic solvent with paraffinic solvent to cause flocculation of Asphaltenes and flocculated Asphaltenes are detected by optical detection.

Porla Analyzer has two methods:

For samples containing Asphaltenes, a complete set of results including P-value, Xylene Equivalent, Solubility Blending Number (SBN), Insolubility Number (IN) are reported.

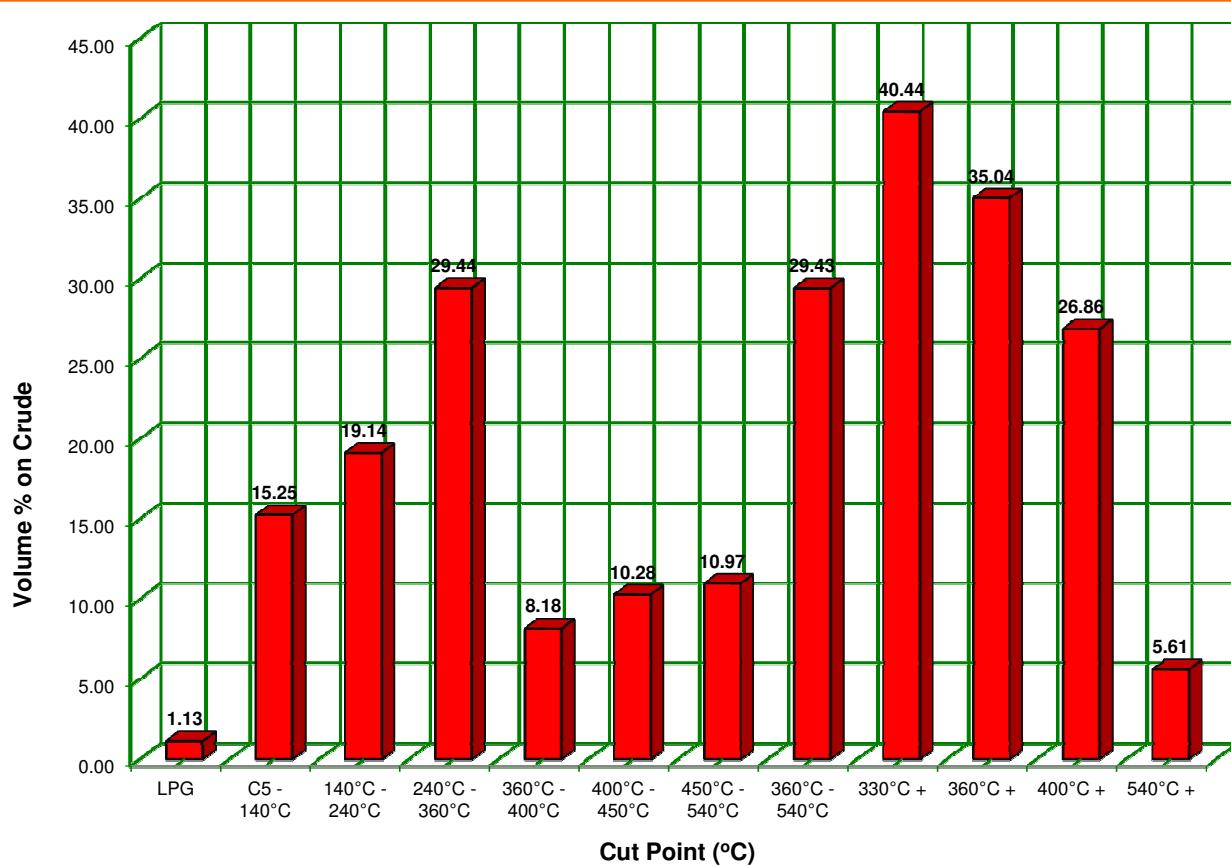

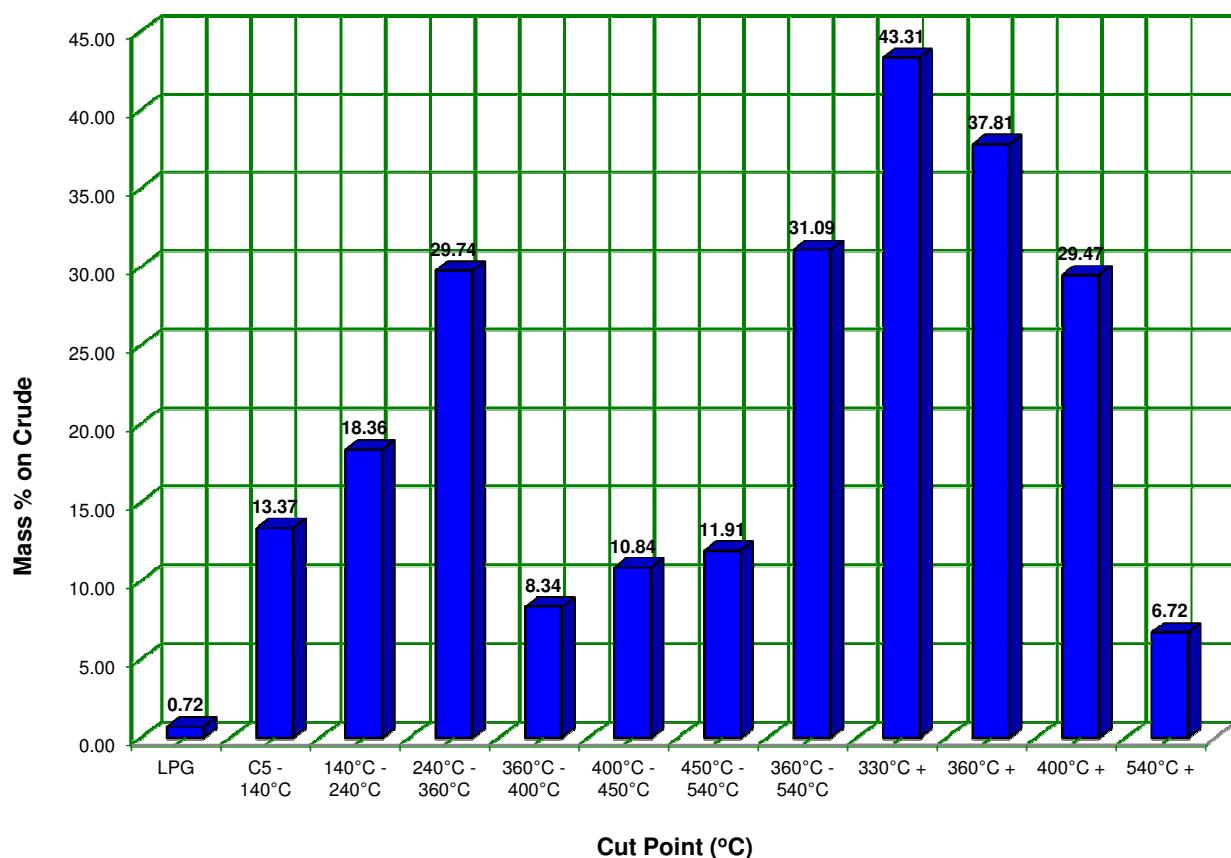

For oil with no Asphaltenes, only the determination of Solubility Blending Number ( $S_{BN}$ ) is possible.

We have tried several attempts to analyze Ravva Crude Oil using normal method, however no flocculation of Asphaltenes was detected by optical detector when the crude sample is titrated using n-Heptane. Therefore, laboratory has proceeded to analyze the crude using Asphaltenes free method which would only provide Solubility Blending Number (SBN) result.

**Table 2 : Summary of Product Cut Points and Yields**

| Cut Point<br>( °C ) | Product        | Yield On Crude (Mass %) |            | Yield On Crude (Volume %) |            |
|---------------------|----------------|-------------------------|------------|---------------------------|------------|

**Remarks :**

- 1) SG @60/60°F and the API is calculated using Table Measurement as mentioned in ASTM D1250.  
2) ## : Cannot perform the test due to the Kinematic Viscosity at 40°C is less than 5.5 cSt.

**Remarks :**

- 1) SG @60/60°F and the API is calculated using Table Measurement as mentioned in ASTM D1250.
- 2) # : Cannot perform the test due to the sample is too dark in color.
- 3) ## : Cannot perform the test due to the sample is not flowing at the test temperature.

**Appendix 2 : Summary of Test Methods**

| <b>Analytical Test</b>  | <b>Method Used</b>  |
|---|---|
| Aniline Point   | ASTM D611- 12   |
| API Gravity @ 60°F  | ASTM D5002 - 13 / D4052 - 11                              |
| Ash Content   | ASTM D482 - 13  |
| Asphaltene Content  | IP 143 - 04   |
| Arsenic Content   | SGS In-House No. LAB/INH/020 ( As by Hydride Generation ) |
| Boiling Point Distribution of crude oils by High Temperature Gas Chromatography | ASTM D7169 - 11   |
| Calculated Cetane Index   | ASTM D976 - 11  |
| Carbon Residue - Micro  | ASTM D4530 - 11   |
| Cloud Point   | ASTM D2500 - 11   |
| Color - ASTM  | ASTM D1500 - 12   |
| Color - Saybolt   | ASTM D156 - 15  |
| Density at 15 °C  | ASTM D5002 - 13 / D4052 - 11                              |
| Density of Semi Solid Bituminous Materials ( Pycnometer Method )                | ASTM D70 - 09e1   |
| Details Hydrocarbon Analysis  | ASTM D6730 - 01( Reapproved 2011 )                        |
| Distillation - Atmospheric  | ASTM D86 - 12   |
| Distillation - Vacuum   | ASTM D1160 - 13   |
| Flash Point - Abel  | IP 170 / 99   |
| Flash Point - PMCC  | ASTM D93 - 15   |
| Freezing Point  | ASTM D2386 - 12   |
| Gross Calorific Value   | ASTM D240 - 14  |
| Hydrogen Sulphide   | UOP 163 - 87  |
| Hydrocarbon Types by FIA  | ASTM D1319 - 14   |
| Kinematic Viscosity   | ASTM D445 - 15  |
| Koup Factor   | UOP 375 - 86  |
| Mercaptan Sulphur   | UOP 163 - 87  |
| Mercury Content   | UOP 938 - 00  |
| Metals Content  | ICP - OES   |
| Naphthalene Content   | ASTM D1840 - 07( Reapproved 2013 )                        |
| Polycyclic Aromatic   | IP 391  |
| Pour Point of Petroleum Products  | ASTM D97 - 12   |
| Pour Point of Crude Oils  | ASTM D5853 - 11   |
| Refractive Index  | ASTM D1218 - 12   |
| Total Vapour Pressure   | ASTM D5191 - 13   |
| Research Octane Number  | ASTM D2699 - 13b  |
| Salt in Crude   | ASTM D3230 - 13   |
| Smoke Point   | ASTM D1322 - 12e2   |
| Specific Gravity @ 60°F   | ASTM D5002 - 13 / D4052 - 11                              |
| Sulphur Content   | ASTM D4294 - 10   |
| Total Acid Number   | ASTM D664 - 11a   |
| Total Nitrogen  | ASTM D5762 - 12 / ASTM D4629                              |
| Trace Sulphur   | ASTM D5453 - 12   |
| True Boiling Point Distillation - 15 Plates                                     | ASTM D2892 - 15   |
| True Boiling Point Distillation - Vacuum Pot Still                              | ASTM D5236 - 13   |
| Water and Sediment ( BSW )  | ASTM D4007 - 11   |
| Water by Crude Oils by Potentiometric Karl Fischer Titration                    | ASTM D4377 - 11   |
| Wax Content   | UOP 46 - 85   |
